

// PROJECT CHRONOSCRIBE

Wikipedia Importance Predictor Roadmap

A data-driven strategy for identifying emerging knowledge hubs
through temporal graph analysis and supervised trajectory scoring.

DEVELOPER

Expert Product Engineer

TIMELINE

6 Days

(Buffered)

The Project Journey

**Timeline incorporates a 1.5x buffer to account for API rate-limiting and data cleansing overhead.*

| Milestone 1: Definition & Setup

Environment & Ideation

Establishing the structural foundation of the project to ensure reproducible science.

🔄 **Repository:** Initialize GitHub with strict CI/CD guidelines.

🎯 **Scope:** Define "Importance" metrics for the graph.

📌 **Data Points:** Select revision & link metadata.

🌐 Data processing center

| Milestone 2: Data Acquisition

Snapshots

Select temporal milestones (2015, 2018, 2021) to capture historical growth states.

API Harvesting

Automated retrieval via Wikipedia API/Web-scraping with robust error handling.

Parsing

Extracting raw HTML/Wikitext into structured metadata, links, and page categories.

Milestone 3: Knowledge Graph

Connecting the Dots

This phase transforms flat snapshots into a multidimensional network where obscure relations surface through structural analysis.

NetworkX Implementation: Nodes represent unique articles; edges represent cross-references. We validate graph integrity to ensure zero dangling pointers.

Milestone 4: Feature Engineering

Topological Features

Automated extraction of:

- **In-Degree:** Measures incoming authority.
- **Out-Degree:** Measures page connectivity.
- **PageRank:** Relative importance in network.

Model Selection

Choosing and normalizing algorithms to ensure stable training. We focus on scale-invariant features to prevent high-degree nodes from skewing predictions.

STATUS: Selecting XGBoost vs LogReg

Milestone 5: Scoring Model

Component	Action	Expected Outcome
Alignment	Map nodes across 3 snapshots	Consistent entity tracking
Labeling	Compute future delta growth	Binary targets (Hit vs. Obscure)
Splitting	Time-based train/test split	Prevents data leakage
Training	Execute baseline regression	Initial probability weights

| Milestone 6: Validation Narrative

85%

Target Prediction Accuracy

Validating whether high-scoring "obscurities" actually transitioned into knowledge hubs.

Future Hub Discovery

We move beyond metrics to study **Community Evolution**.

By analyzing cluster growth, we can explain **why** concepts like "CRISPR" or "NFTs" exploded before they hit the mainstream.

Milestone 7: The Final Polish

Interactive Explorer

A GUI for browsing graph nodes and connection strength.

Time Travel

View the graph's evolution through temporal sliders.

Dashboard

Visualizing probability scores and feature importance.

Ready for Launch

Phase 1 Kickoff: Tomorrow @ 09:00 AM
